

1. Data Section

Following sources of data are used while executing the Insurance Zip Code Risk Model Project: -

- **Data title: -**
Open Data published by the New York City Police Department under the section **Collisions**.

Type of datasource: -

JSON File by using API Rest

Time Interval: -

From January 2018 until today

Description of the dataset: -

The New York Collisions dataset has the last year crash accidents from the city. It is possible to identify collisions per borough and per ZIP Code.

The dataset was downloaded in JSON Format by using an API Rest query to the New York City open data hub.

It is important to know that we need the collisions resume by Zip Code. The Resume needs the zipcode id, and the number of accidents and a new variable identifying whether a zip code is risky and whether not. The last variable is created by using the two highest deciles to represent a high risk and others.
